-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4 beta-D-glucosidic
linkages in cellulose, lichemin and cereal beta-D-glucans.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: HYPHAL TIP.
-!- DEVELOPMENTAL STAGE: EXPRESSED IN FILAMENTOUS DIKARYON.
-!- PTM: MAY ALSO BE O-GLUCOSYLATED.
-!- PTM: MAY ALSO BE O-GLUCOSYLATED.
-!- SIMILARITY: BELONGS TO CELLULASE FAMILY K (FAMILY 45 OF GLYCOSYL
                                                                                                                                                                                                                                                                                                            Gaps

J. Bacteriol. 172:2131-2140(1990).
-!- FUNCTION: AS IS COMMONLY PRODUCED BY SOIL MICROORGANISMS AND PLAYS AN IMPORTANT ROLE IN THE MIRREALIZATION OF SULFATES.
-!- CATALYTIC ACTIVITY: A phenol sulfate + H(2)0 = a phenol + sulfate.
-!- SIMILARITY: BELONGS TO THE SULFATASE FAMILY.

J. Biochem. 251:98-106(1998).

-!- COFACTOR: Requires a divalent metal ion for activity, optimum activity is obtained with Mn(2+).

-!- ENZYME REGULATION: Inhibited by sodium oxalate.

-!- PATHWAY: 3 - hydroxyphenylpropionate degradation.

-!- PATHWAY: 3 - hydroxyphenylpropionate degradation.

-!- SIMILARITY: BELONGS TO THE TODJ/XXLJ/HPCG FAMILY.
                                                                                                                                                                                                            Bscherichia coli.

28-denosylmethionine: RNA ribosylrransferase-isomerase (EC 5.-.-.)
(Queuosine biosynthesis protein queah).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           adenosylmethionine-requiring step. The ribosyl moiety of AdoMet transferred and isomerized to the epoxycyclopentane residue of (By similarity).

-I- PATHWAY: Queuosine biosynthesis.
-I- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HAMÁÞ; MF_00113; -; 1.

"Disproportionating enzyme (4-alpha-glucanotransferase; EC 2.4.1.25)
of potato. Purification, molecular cloning, and potential role in starch metabolism.";

J. Biol. Chem. 268:1391-1396(1993).

C. I- FUNCTION: MAY ACT DURING STARCH BREAKDOWN TO CONVERT SMALL OLIGOSACCHARIDES INTO LARGER MOLECULES UPON WHICH STARCH PHOSPHORYLASE CAN ACT, OR MAY CHANGE THE STRUCTURE OF STARCH MOLECULES AND GRAIN ARCHITECTURE BY MODIFYING CHAIN LENGTH, OR MAY GENERATE FROM STARCH AND GLUCOSE OLICOSACCHARIDES WHICH CAN SERVE EITHER AS PRIMERS FOO NEW STARCH PHOSPHOENZYME.

C. I- CATALYTIC ACTIVITY: Transfers a segment of a (1,4)-alpha-D-glucan to a new 4-position in an acceptor, which may be glucose or (1,4)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TISSUE SPECIFICITY: PRESENT IN LEAVES, STEMS, ROOTS, AND STOLONS BUT IS MOST ABUNDANT IN DEVELOPING AND MATURE TUBERS. SIMILARITY: BELONGS TO THE DISPROPORTIONATING ENZYME FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

"Characterization of a DNA topolsomerase Italpha gene rearrangement in adriamycin-resistant P388 leukemia: expression of a fusion messenger RNA transcript encoding topolsomerase Italpha and the retinoic acid receptor alpha locus.";

Cancer Res. 53.5885-5889(1993).

-! FUNCTION: COMPROL OF TOPOLOGICAL STATES OF DNA BY TRANSIENT BREAKAGE AND SUBSEQUENT REJOINING OF DNA STRANDS. TOPOISOMERASE IN MARES DOUBLE-STRAND BREAKS.

-! CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SPARATION OF THE STATE OF STAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBCELLULAR LOCATION: Nuclear.
MISCELLULAR LOCATION: ULCLAR TOPOISOMERASE I AND II CAN RELAX BOTH
MISCELLANEOUS: EUKARYOTIC TOPOISOMERASE I AND II CAN RELAX BOTH
NEGATIVE AND POSITIVE SUPERCOILS, WHEREAS PROKARYOTIC ENZYMES.
RELAX ONLY NEGATIVE SUPERCOILS.
SIMILARITY: Belongs to the type II topoisomerase family.

motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts /osteoclasts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a C-terminal amidated synthesised peptide D-00006 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to dental products such as toothpastes, mouthwash and dental floss comprising a base material and a compound which promotes bone growth. Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of osteoblast or odontoblast cells on the surface of the new skeletal growth. AAU33681-AAU33726 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dental product useful for treating skeletal diseases e.g. dental diseases comprises a base material and a compound comprising specific amino acid in a sequence containing the integrin binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dental product; toothpaste; mouthwash; dental floss; bone growth; integrin binding motif; RGD; skeletal disease; dental disease; tooth; alveolar bone growth; osteoblast; odontoblast; osteopathic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                               The present invention relates to dental products such as toothpastes, mouthwash and dental floss comprising a base material and a compound which promotes bone growth. Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of esteoblast or adontoblast cells on the surface of the new skeletal growth. AAU33681-AAU33726 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss; weakness; D00006.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             οŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide compound useful for reducing bone loss, is capable enhancing bone growth, and comprises an integrin binding motif, glycosaminoglycan binding motif or a calcium binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide compound capable of enhancing bone scrowth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D-or L-conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing regard phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a protein of a matrix extracellular phosphoglycoprotein containing an RGD motif of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                          Bone growth, RGD motif, integrin binding motif, calcium binding motif, glycosaminoglycan binding motif, bone loss, renal phosphate excretion, alveolar, teeth, odontoblast, osteoclast, dental tissue, skeletal loss,
                                                                                                                                                                                                                                                                                                                                                         Protein of matrix extracellular phosphoglycoprotein containing RGD #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide compound useful for reducing bone loss, is capable of enhancing bone growth, and comprises an integrin binding motif, glycosaminoglycan binding motif or a calcium binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present sequence represents a phosphatonin polypeptide (also called Metastatic-tumour Excreted Phosphaturic-Element (MEPE). The level of phosphaton in a subject modulates Na+-dependent phosphate corransport, vitamin D metabolism and/or bone mineralisation. The phosphatonin to polypeptides, polymucleotides, vectors and antibodies are used to treat phosphate metabolism related disease. They are used for treatment of hyperphosphatemia, or renal osteodystrophy, hyperphosphatemia in renal dalysis/pre-dialysis, secondary hyperparathyrodism or ostetis fibrosa cystica, or X-linked hypophosphatemic rickets, hereditary hypophosphatemic rickets with hyperalcuria (HRRH), hypominaralised hypophosphatemic rickets with hyperacilcuria (HRRH), hypominaralised costeomalacia, renal phosphate leakage, renal osteodystrophy, osteomalacia, vitamin D resistent rickets, end organ resistance, renal ranches, autosomal rickets, end organ resistance, renal ranches, autosomal rickets, end organ resistance, renal tubular acidosis, cystic fibrosis or sprue. The polypeptide may also be used to manifacture combined preparations for simultaneous, desparate or sequential use for the treatment of phosphate metabolism disorders. A transformed osteoblast or bone cell line capable of the characterial or special for the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptides involved in the regulation of phosphate metabolism useful for diagnosing and treating disorders related to phosphate

```
The invention relates to a novel human protein, metastatic-tumour excreted phosphaturic element (MEPE) or phosphatonin (modulator of phosphate and vitamin-D metabolism). The phosphatonin polypeptides, polymucleotides and specific antibodies are useful for treating a disorder of phosphate or vitamin D metabolism, skeletal formation and mineralization. Phosphatonins are used to treat hyperphosphatemia, renal osteodystrophy, secondary hyperparathyroidism, osteitis fibrosa cystica or gout. It is used to prepare a medicament for treating X-linked hyperposphosphatemic rickets, hereditary hyperposphatemic rickets with hypercalcuria (HHRH), hypomineralized bone lesions, stunted growth in juveniles, oncogenic hypophosphatemic osteomalacia, renal phosphatemic organ resistance, renal fanconi syndrome, autosomal rickets, paget's cand organ resistance, renal tubular acidosis, cystic fibrosis or spruce. Phosphatonin polymorlocides are useful as molecular weight markers on Southern gels, as diagnostic probes for detecting the presence of a specific mRNA. Phosphatonin polypeptides are also useful for cidentifying agonists and antagonists compounds which bind to phosphatonin and drug candidates for therapy of phosphate metabolism choosing a truncated form of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New phosphatonin polypeptide a regulator of phosphate metabolism, for diagnosing and treating disorders of phosphate, vitamin-D metabolism, skeletal formation e.g. osteoporosis, Paget's disease, gout
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 4; Fig 8; 135pp; English

Colseoregulin is a novel protein which plays a roole in regulating bone homeostasis, adiposity, and the calcification of atherosclerotic plaques. 2 Splice variants of human osteoregulin exer identified (see also AAB82921). The invention provides novel osteoregulin proteins, nucleic acids which encode them, vectors, animal cells and mammals with a targeted disruption of an enimal cells and mammals with a targeted disruption of an osteoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with in the manufacture of a medulators of activity may be useful in the manufacture of a medulators of activity may be useful in the manufacture of a medulators of activity may be useful mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification claimed), for treating and preventing osteoporosis, and for stimulating bone repair and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel osteoregulin polypeptide useful for regulating bone homeostasis, adiposity and calcification of atherosclerotic plaques comprises measuring the activity of osteoregulin -

which plays a role in regulating bone homeostasis, adiposity, and the calcification of atherosclarotic plaques. The sequence is considered from the mucleotide sequence (see AA126808) of isolated predicted from the nucleotide sequence (see AA126808) of isolated costeoblast cDNA. A spile avainat of human osteoregulin was also identified (see AA882921). The invention provides novel costeoregulin proteins, nucleic acids which encode them, vectors, antibodies, host calls which express heterologous osteoregulins, and canimal cells and mammals with a targeted disruption of an costeoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with in the manufacture of a medicament for, as well as for treating, a mammal in need of regulation of bone mass and/or density, adiposity, canamal in need of regulation of bone mass and/or density, and/or atherosciencic plaque calcification (claimed), for treating and preventing osteoporosis, and for stimulating bone repair and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel osteoregulin polypeptide useful for regulating bone homeostasis, adiposity and calcification of atherosclerotic plaques comprises measuring the activity of osteoregulin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sprue. Phosphatonin polynucleotides are useful as molecular weight markers on Southern gels, as diagnostic probes for detecting the presence of a specific mRNA. Phosphatonin polypeptides are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel human protein, metastatic-tumour excreted phosphaturic element (MEPE) or phosphatonin (modulator of phosphate and vitemin-D metabolism). The phosphatonin polypeptides, polynucleotides and specific antibodies are useful for treating a disorder of phosphatonins are used to treat hyperphosphatemia, mineralization. Phosphatonins are used to treat hyperphosphatemia, renal osteodystrophy, secondary hyperparathyroidism, osteitis fibrosa cystica or gout. It is used to prepare a medicament for treating X-linked hypercalcuria (HHRH), hypomineralized bone lesions, stunted growth in hypercalcuria (HHRH), hypomineralized bone lesions, stunted growth in juveniles, oncognic hypophosphatemic osteomalacia, renal phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        leakage, renal osteodystrophy, osteoporosis, vitamin-D resistant rickets, end organ resistance, renal Fanconi syndrome, autosomal rickets, Paget's disease, kidney failure, renal tubular acidosis, cystic fibrosis or

The proteins are cytostatic, antidabetic and antiinflammatory in their action. Phosphatonin down-regulates sodium-dependent phosphate transport in the kidney, it down-regulates 25-hydroxy-vitemin D3-1alpha-hydroxylase in the kidney and up-regulates 25-hydroxy-vitemin D3-24-hydroxylase in the kidney. Phosphatonin is useful in the diagnosis, treatment and prevention of phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             metabolism related diseases such as hyperphosphaemia, arteriosclerosis, heart failure, diabetic renal disease, kidney failure, acute coronary disease and cystic fibrosis. This sequence represents human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                             Phosphatonin of human origin and DNA encoding it for diagnosis and treatment of diseases associated with disorders of phosphate metabolism, e.g., hyperphosphaemia, arteriosclerosis, heart failure, diabetic renal disease and kidney failure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to oncogenic osteomalacia-related protein 1
designated OOM1 (oncogenic osteomalacia-related factor) and its DNA
molecule. OOM1 protein is useful for treating a phosphate homeostasis-
related disease such as X-linked hypophosphateamia rickets, oncogenic
osteomalacia, rhabdomyolysis, cardiomyopathy, tumoural calcinosis and
renal failure. OOM1 proteins and DNA's are useful for modulating the
C phenotype of a neoplastic cell associated with oncogenic osteomalacia,
modulating bone mineralisation; and treating a disease characterised by
abnormal bone mineralisation; and treating an oncogenic osteomalacia-
c associated symptom auch as hypophosphateamia, phosphaturia, low serum
concentrations of 1.25-dihydroxy vitemin D or osteomalacia. OOM1 is
useful for modulating renal phosphate transport, which involves altering
the activity of OOM1 within a cell and then administering serine protease
11 to the cell OOM1 within a cell and dentifying single nucleotide
animal models, and for searching and identifying single nucleotide
polymorphisms which are mutants, variants of the gene in human
                                                                                                                                                                                 /label= Signal_peptide

Colsteoregulin is a novel protein which plays a role in regulating costeoregulin is a novel protein which plays a role in regulating concerning a diposity, and the calcification of atherosclerotic plaques. 2 Splice variants of human osteoregulin were identified (see also AAB2292). The invention provides novel osteoregulin proteins, nucleic acids which encode them, vectors, antibodies, host cells which express heterologous osteoregulins, and animal cells and mammals with a targeted disruption of an animal cells and mammals with a targeted disruption of an canimal cells modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with costeoregulin activity. The modulators of activity may be useful in the manufacture of a medicament for, as well as for treating, a mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification
  OOM1 is useful as an immunogen to produce antibodies agains vitro assays to screen for agents or drugs, which modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel osteoregulin polypeptide useful for regulating bone homeostasis, adiposity and calcification of atherosclerotic plaques comprises measuring the activity of osteoregulin -
                                                                                                                                                                                                                                          Gape
                                                       osteomalacia-related protein-1 (00M-1).

Note: The present sequence states that this sequence is encoded by DNA sequence shown in SEQ ID NO: 1 (AAD21889) of the specification However this does not appear to be the case.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; bone; homeostasis; adipose; calcification; is; osteoporosis; osteopathic; antiarteriosclerotic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of human osteoregulin, a novel protein which plays a role in regulating bone homeostasis, adiposity, and the calcification of atherosclerotic plaques. The sequence is predicted from the nucleother of number of sequence (see AAH26809) of isolated osteoblast cDNA. A splice variant of human osteoregulin was also identified (see AAB8220). The invention provides novel osteoregulin proteins, nucleic acids which encode them, vectors, antibodies, host cells which express heterologous osteoregulins, and animal cells and mammals with a targeted disruption of an osteoregulin gene. The invention also provides screening assays to identify modulators of osteoregulin activity as well as methods of treating mammals for diseases or disorders associated with osteoregulin activity. The modulators of activity may be useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to dental products such as toothpastes, mouthwash and dental floss comprising a base material and a compound which promotes bone growth. Such compounds are peptide sequences comprising 10-50 amino acids and containing an integrin binding motif such as RGD in the D- or L- form, preferably the L-configuration. The peptides of the invention are useful for treating or preventing skeletal diseases such as dental disease. The peptides enhance tooth and/or alveolar bone growth on areas where deterioration has occurred, as well as the growth or recruiting of esteoblast or dontoblast cells on the surface of the new skeletal growth. AAU93081-AAU93126 represent bone growth enhancing peptides for use in dental products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dental product; toothpaste; mouthwash; dental floss; bone growth; integrin binding motif; RGD; skeletal disease; dental disease; tooth; alveolar bone growth; osteoblast; odontoblast; osteopathic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dental product useful for treating skeletal diseases e.g. dental diseases comprises a base material and a compound comprising specific amino acid in a sequence containing the integrin binding motif
                                                                                                                                                                                                                                                                             Gaps
mammal in need of regulation of bone mass and/or density, adiposity, vascular flexibility, and/or atherosclerotic plaque calcification (claimed), for treating and preventing osteoporosis, and for stimulating bone repair and regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a peptide compound capable of enhancing bone growth, and comprising 10-50 amino acids in a sequence, where the amino acids are in D- or L- conformation and the sequence comprises a motif selected from an integrin binding motif, a glycosaminoglycan binding motif and a calcium binding motif. The peptide of the invention is useful for reducing bone loss and for reducing renal phosphate excretion in an individual. The peptide is useful for promoting regeneration of alveolar bone and/or teeth, and increases the number and activity of odontoblasts of steaclasts that help form dental tissues. The peptide is also useful for treating or preventing a condition associated with skeletal loss or weakness. This sequence represents a protein of a matrix extracellular phosphoglycoprotein containing an RGD motif of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bone growth; RGD motif; integrin binding motif; calcium binding motif; glycosaminoglycan binding motif; bone loss; renal phosphate excretion; alveolar; teeth; odontoblast; osteoclast; dental tissue; skeletal loss; weakness; matrix excracellular phosphoglycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein of matrix extracellular phosphoglycoprotein containing RGD #23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide compound useful for reducing bone loss, is capable of enhancing bone growth, and comprises an integrin binding motif, glycosaminoglycan binding motif or a calcium binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure, Page 12; 50pp; English.

Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: MARC J.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR SPUICH DATE: 1998-02-18
PRIOR SPUICH DATE: 1998-02-18

Section 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNI FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT PILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
